

Giuseppe Costa

A metric for co-creation in an urban community setting: the Turin case study

The project is a result of 40 years of research in the field of reducing health inequalities. A review of the past 40 years of health inequalities in Turin was published in 2017 with the support of Compagnia San Paolo and its results are disseminated through the Turin case study. The project was guided by the methodological approach of action research that aims to promote change in the real world and to implement innovative practices.

Giuseppe would like people to see and understand the power of social inequalities and health equity criterium. This data is a way to understand that someone is doing better than others and then it comes with the responsibility to inquire and discover why it happens.

Giuseppe can share his access to different initiatives across Europe focusing on Health Equity (he coordinates the European Joint Action in that area).

Values and expertise

Governance team

There are 2 main levels of governance, the special infrastructure of health monitoring led by SEPI (Regional Health Observatory) and the healthcare policy level introduced by authorities based on the data provided by SEPI. The governance is focused on the interaction between epidemiologic units and authorities of the region to integrate the activities at the local level (health authority level) and to integrate metrics of health outcomes and inequalities as a common language that enables to development of health plans based on the needs of the communities.

*Prof. Public Health
University of Turin, Head
of the Regional Health
Observatory (SEPI).*

- How to find and define specific solutions to be implemented?
- How to improve the structure and process of governance during implementation?
- How to build a collaboration between different initiatives and actors focused on different aspects of the community?
